WP3 Objectives

- **EU Targets**
 - 20 % CO₂ reduction
(vs. Best-In-Class CNG Vehicle 2014)
 - 600 km range
 - EU6+ emissions
- **Additional WP3 Targets**
 - Fun-to-drive (110 kW, 240 Nm)
 - 7-seater van

Gas-Only Internal Combustion Engines

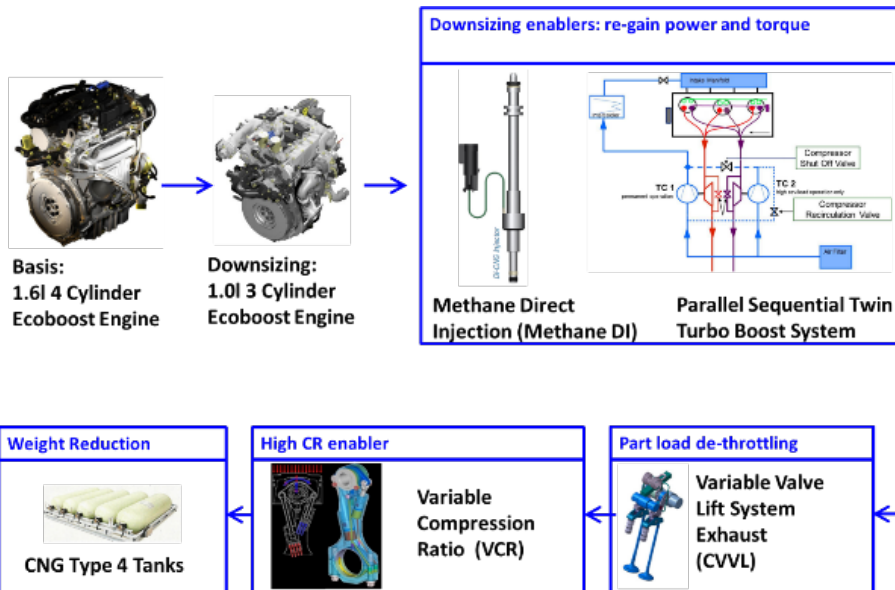

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Comparison of 2 Competing Technology Walks

Technology Walk #1

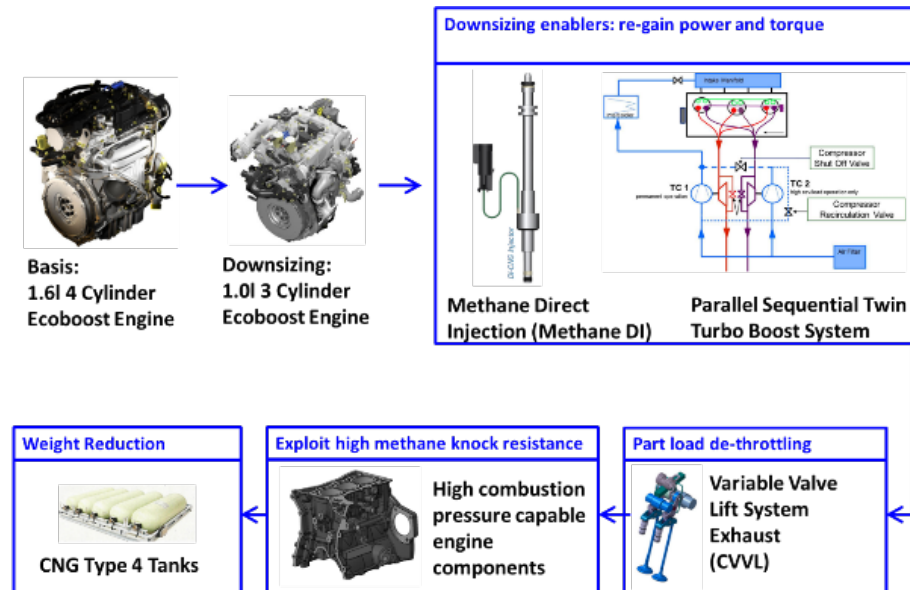

VCR engine

Investigated and compared in engine dynamometer tests

Technology Walk #2

Non-VCR engine & high combustion pressure capable engine architecture

Selected for vehicle installation in GA 22. June 2018

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines

Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Main tasks

Base Engine Design, New Technology Integration, Combustion System Development (CAE and dyno tests)
(FORD)

CNG DI injection system development and prototyping
(DELPHI, FORD)

Advanced parallel sequential boosting system development, packaging and prototyping
(CONTINENTAL, FORD)

Continuously variable valve lift (CVVA – Upvalve®) system development, packaging and prototyping
(PIEBURG, FORD)

Variable Compression Ratio (VCR) system development, packaging, prototyping and testing
(FEV, SCHAEFFLER, FORD)

Controls System Development, Steady State Calibration, Vehicle Calibration
(CONTINENTAL, FORD)

Design storage system, engine & subsystems installation on demo vehicle, refinement & full assessment
(FORD, CONTINENTAL)

Base Engine Design - CAE optimization (Ford)

CAE optimization of all new engine components. Particular focus on high maximum pressure capability in order to exploit high knock resistance of CNG.

Cylinder head
thermal analysis

Cylinder head
high cycle fatigue
calculation

Cylinder block temperature analysis by CAE at
different power levels

Further CAE high pressure optimization of:

- Pistons
- Crankshaft
- Con rod
- Crankshaft and Con rod Bearings

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Base Engine Design (Ford / FEV)

Doubled expense for dedicated VCR and Non-VCR components

Unequal piston designs for VCR and Non-VCR version

Further differences between VCR and Non-VCR version

- Con rod
- Crankshaft and con rod bearings

Unequal crankshaft designs for VCR and Non-VCR version

Base Engine Combustion System Development (Ford)

CAE optimization: combustion system, port and piston design, injection process

Skew Injector Straight injector

Effect of two injector angles
on the air/fuel homogeneity

CFD exhaust ports mass flow
rate optimization

CNG Direct Injection (Delphi)

CNG direct injection developed and adapted for dedicated CNG engine (high pressure capability, high power → high flow)

- Lifetime durability demonstration on laboratory test bench
- Injector equipped with injector driver box
→ Load specific adaption of electrical current profile

Advanced parallel sequential boosting system development (Continental)

Parallel sequential boosting system matched to achieve 120 kW /240 Nm

› Simulation of air path (Continental / Ford)

› Matching & aero design (Continental)

Challenges:

- Design: turbine diameter $D_2 = 39\text{mm}$
- Number of revolutions: 285,000 rpm
Peripheral speed: 580m/s
Mitigation: min-min bearing & balancing
- Compressor stability for $\pi=3.4$

› Manufacturing (Continental)

› Testing (Continental / Ford)

- Performance testing on hot gas test bench
- Verification of functionality and robustness in engine dynamometer tests

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines

Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

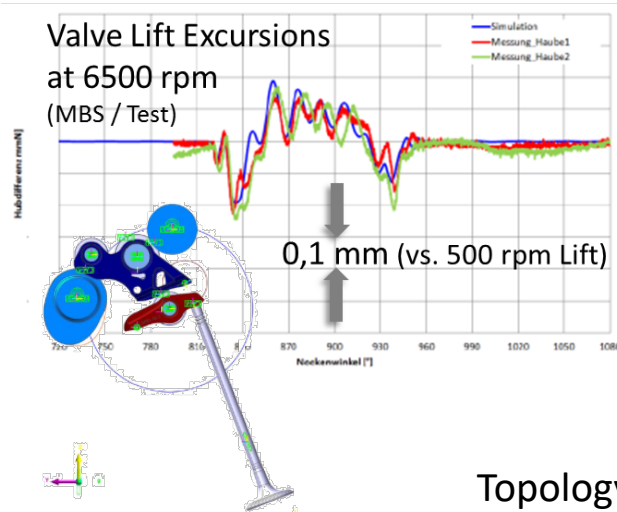

Continuously variable valve lift (CVVA – Upvalve[®]) system (Pierburg)

CVVA system designed and packaged as cylinder head cover.

Continuously variable valve lift (CVVA – Upvalve®) system (Pierburg)

Application to high combustion pressure capable engine design by significant CAE support and extensive component testing during CVVA development.

FEM

- Mechanical Stress Analysis

Topology Optimisation

- Reduction of Mass and Inertia

Multibody Simulation

- Dynamic Valve Train Performance
- Valve Spring Layout

Single Cylinder Mock-Ups &
Multi Cylinder Head Test Rig

- Motored Cam and Control Shaft
- Oil Conditioning (Pressure/ Temp.)
- Online Valve Lift Measurement via Laser Vibrometer

Gas-Only Internal Combustion Engines

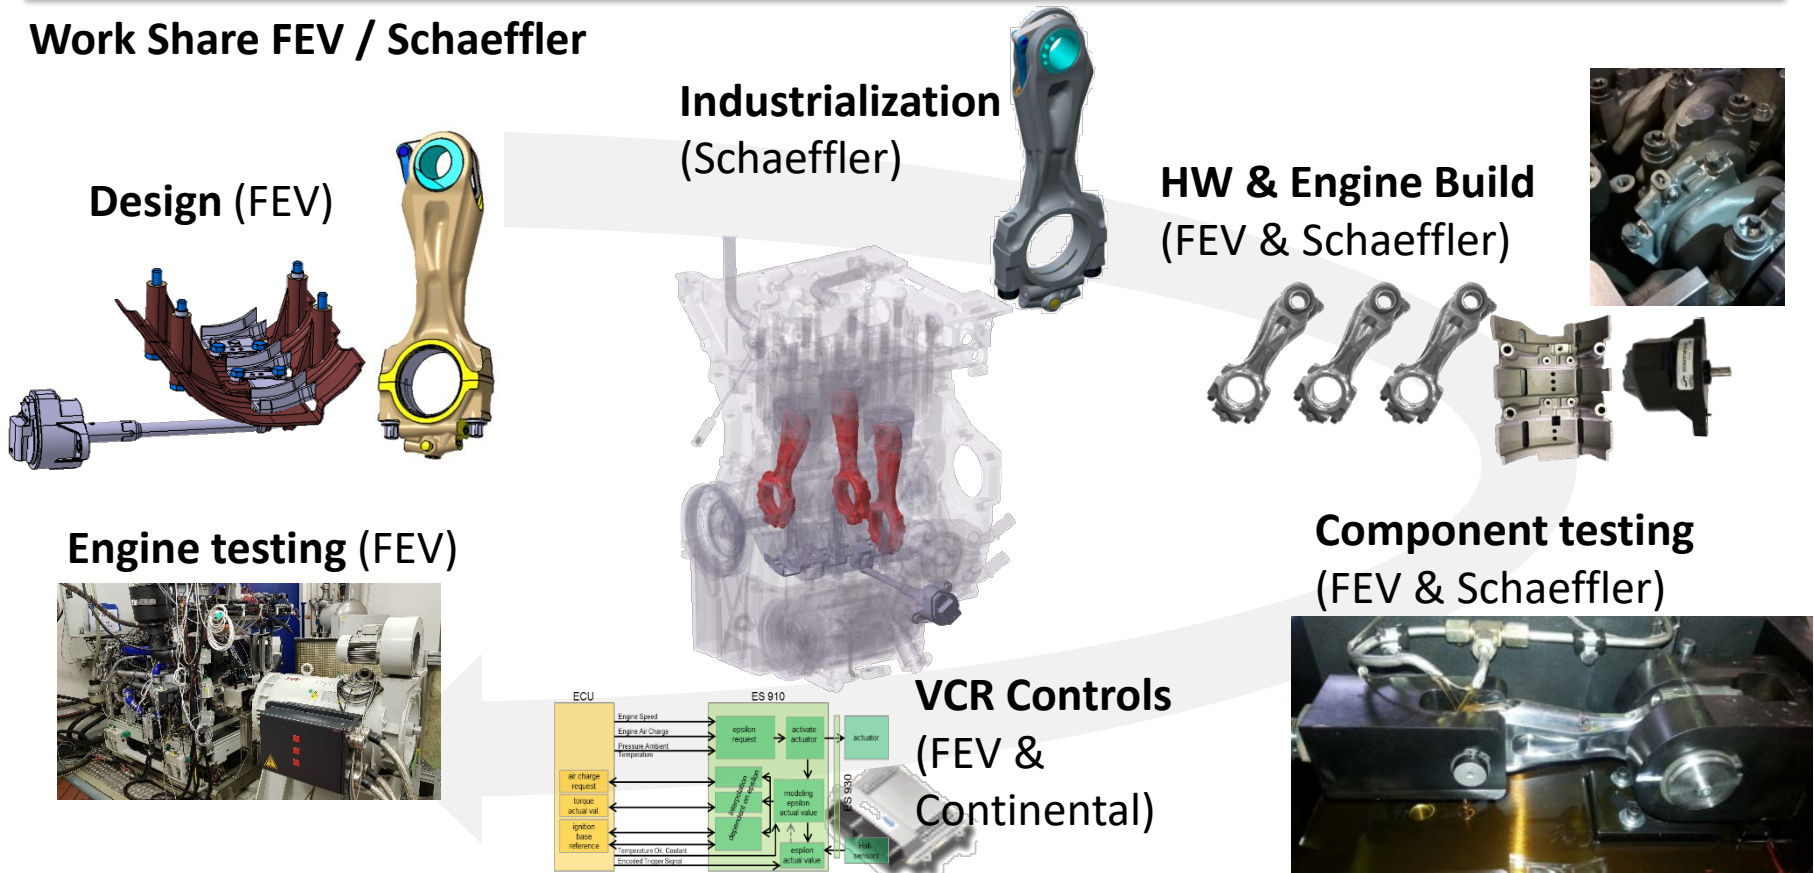

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Variable Compression Ratio VCR system development (FEV & Schaeffler)

VCR, a highly effective measure for CO₂-reduction in gasoline engines, in GasOn mainly expected as an enabler for lowering peak pressure requirements.

Work Share FEV / Schaeffler

Variable Compression Ratio VCR system development (FEV)

VCR switching time satisfying (in relevant range up to 3000 rpm)

Exemplary VCR Shift $CR_{high} \rightarrow CR_{low}$

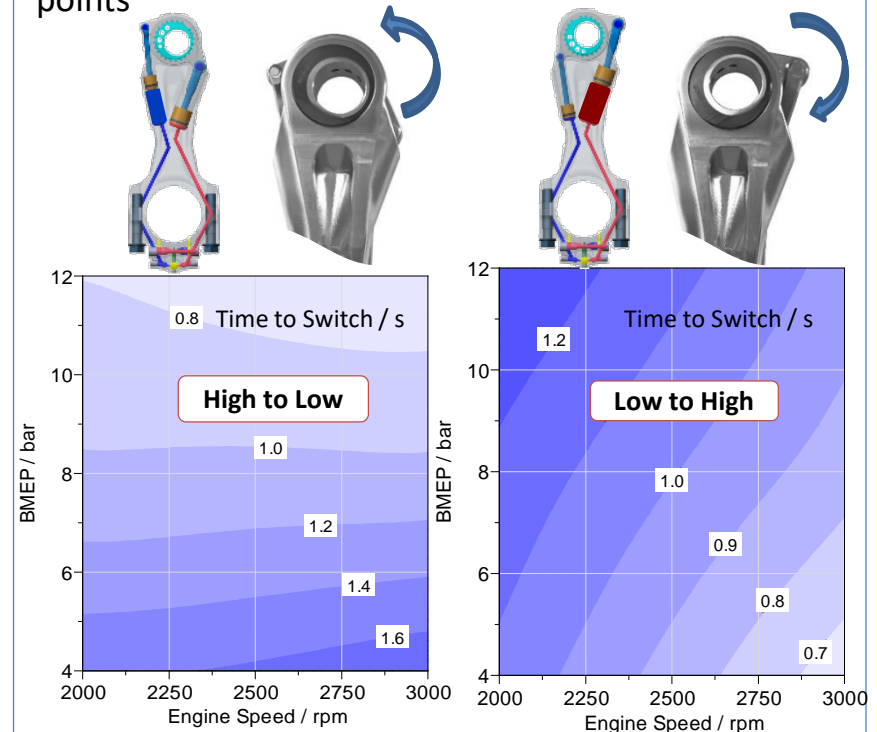

Ignition angle adaptation during shifting from CR13 to CR 9.8 using ECU Bypass \rightarrow torque-neutral

CR 13 to 9.8 at 2000 rpm and 20 bar BMEP

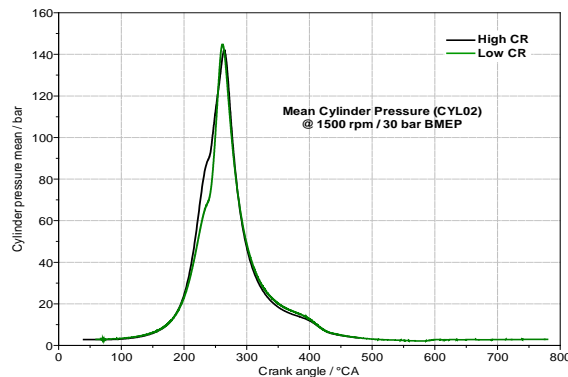

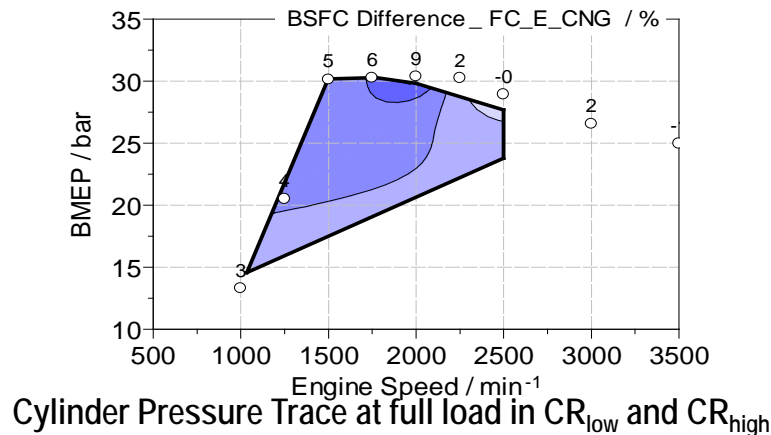

VCR Switch Mapping

Fast switching time in relevant engine operating points

Variable Compression Ratio VCR system development (FEV)

BSFC DIFFERENCE: VCR CR 9.8 vs Non-VCR CR 13

- Full load torque 240 Nm, (BMEP 30 bar) at 1500 rpm achieved with VCR engine
 - No knocking / no pre-ignitions with CR low
 - 5-9 % higher fuel consumption with low compression ratio (which needs to be adjusted at the VCR engine for full load operation)
 - Only minor Peak Pressure Difference between Low CR and High CR (at opt. efficiency settings)
- => Low compression ratio not beneficial as long as fuel is not knock limiting

Source: FEV

Variable Compression Ratio (VCR) system development (FEV)

With knock resistant fuel CNG and at high engine loads: higher fuel consumption and only minor peak pressure reduction of the VCR version (@CR low) vs. the Non-VCR version

- The main reason for this unexpected results is the generally high knocking resistance of CNG fuel, combined with the achieved high combustion pressure capability of the Non-VCR engine, without increasing the engine friction significantly.
- **Due to the CO₂ penalty, it was decided to proceed the vehicle installation and calibration with the Non-VCR version (Decision GA meeting June 2018)**

Base Engine Design (Ford) - Confirmation of Base Engine Robustness

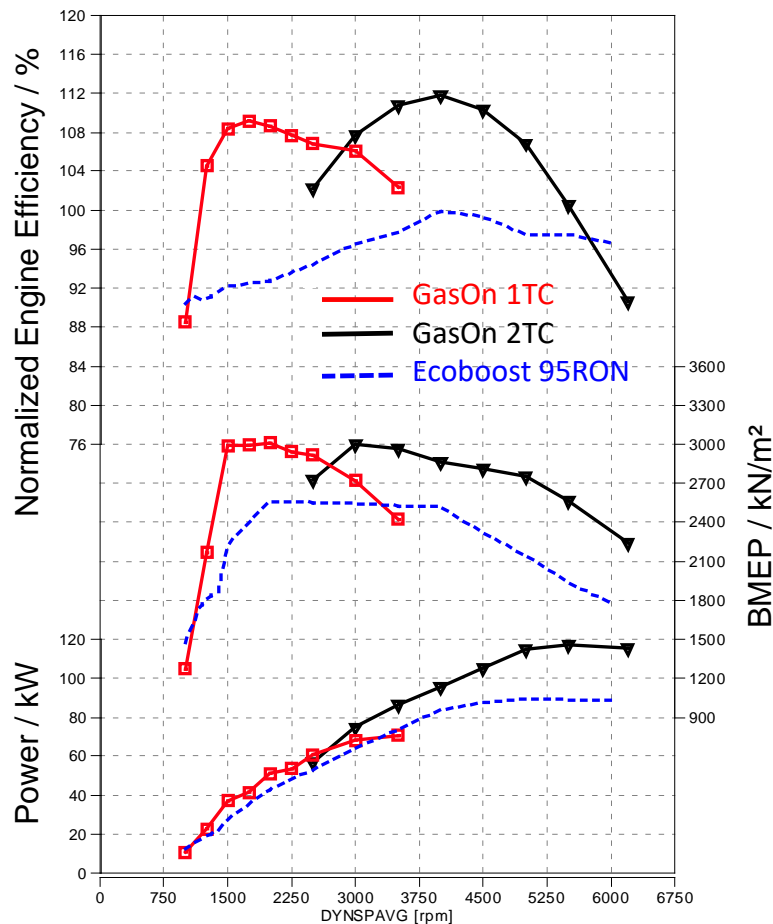

Confirmation of High Combustion Pressure Capability and Robustness by approx. 3,500 hours of dyno operation.

- 3 Non-VCR engines tested for ~ 1780 hrs, 700 hrs and 950 hrs (engine dyno at FORD).
- VCR engine tested for 120 hrs (engine dyno at FEV).
- Sometimes very severe conditions: peak combustion pressure up to 250 bar (due to pre-ignition → significantly higher than the development target of 185 bar).

Combustion System Development (Ford) - Power, Torque, Efficiency

Power target (110 kW) overachieved (120 kW). BMEP target (30 bar) achieved.

Engine dyno test data:

- GasOn WOT efficiency (normalized on basis: gasoline 95 RON; 1.0l Ecoboost®)
 - + 12 % peak efficiency (@ 4000 rpm)
 - + 16 % @ 1500 rpm
- Max BMEP 30bar @ 1500...3500 rpm → **target achieved**
- Peak Power 120kW (163hp) **overachieves target of 110 kW (150 hp) with Lambda 1 operation !**

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines

Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Combustion System Development - Peak Pressure, Combustion Phasing

Still efficient combustion phasing (22 ... 21 °CA ATDC) at high BMEP level of 30 bar, limited by combustion peak pressure limit of 185 bar.

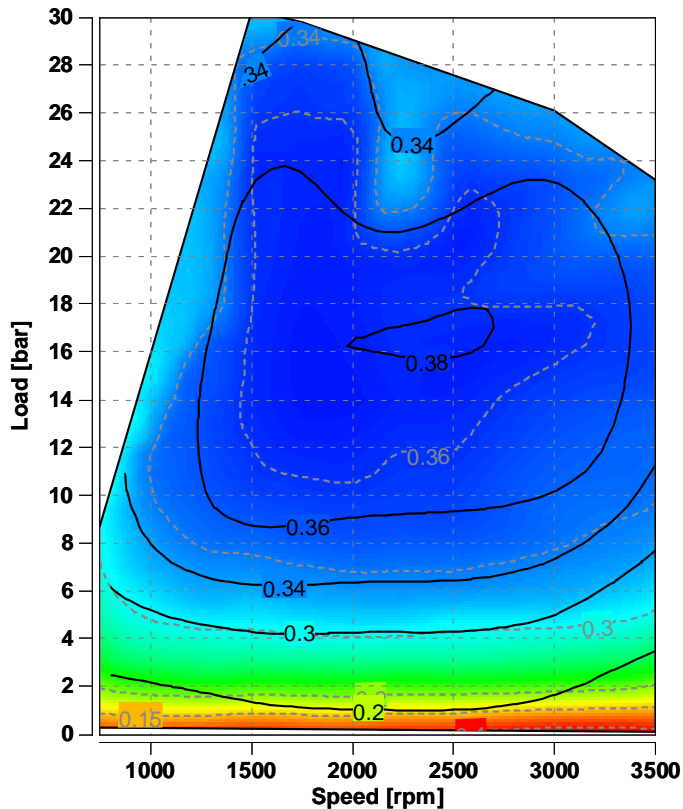

- 50% above current production engine (Peak combustion pressure 185 bar, 1.0l Ecoboost, 95 RON) reaching limits of dedicated engine architecture
- Only slightly retarded combustion phasing ($MFB_{50} = 22 \dots 21^\circ\text{CA ATDC}$) in combustion pressure limited rpm range (1500 ... 3000 rpm)

Combustion System Development (Ford) - Efficiency Non-VCR Engine

Best efficiency > 38 %. Very wide area > 30 %.

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

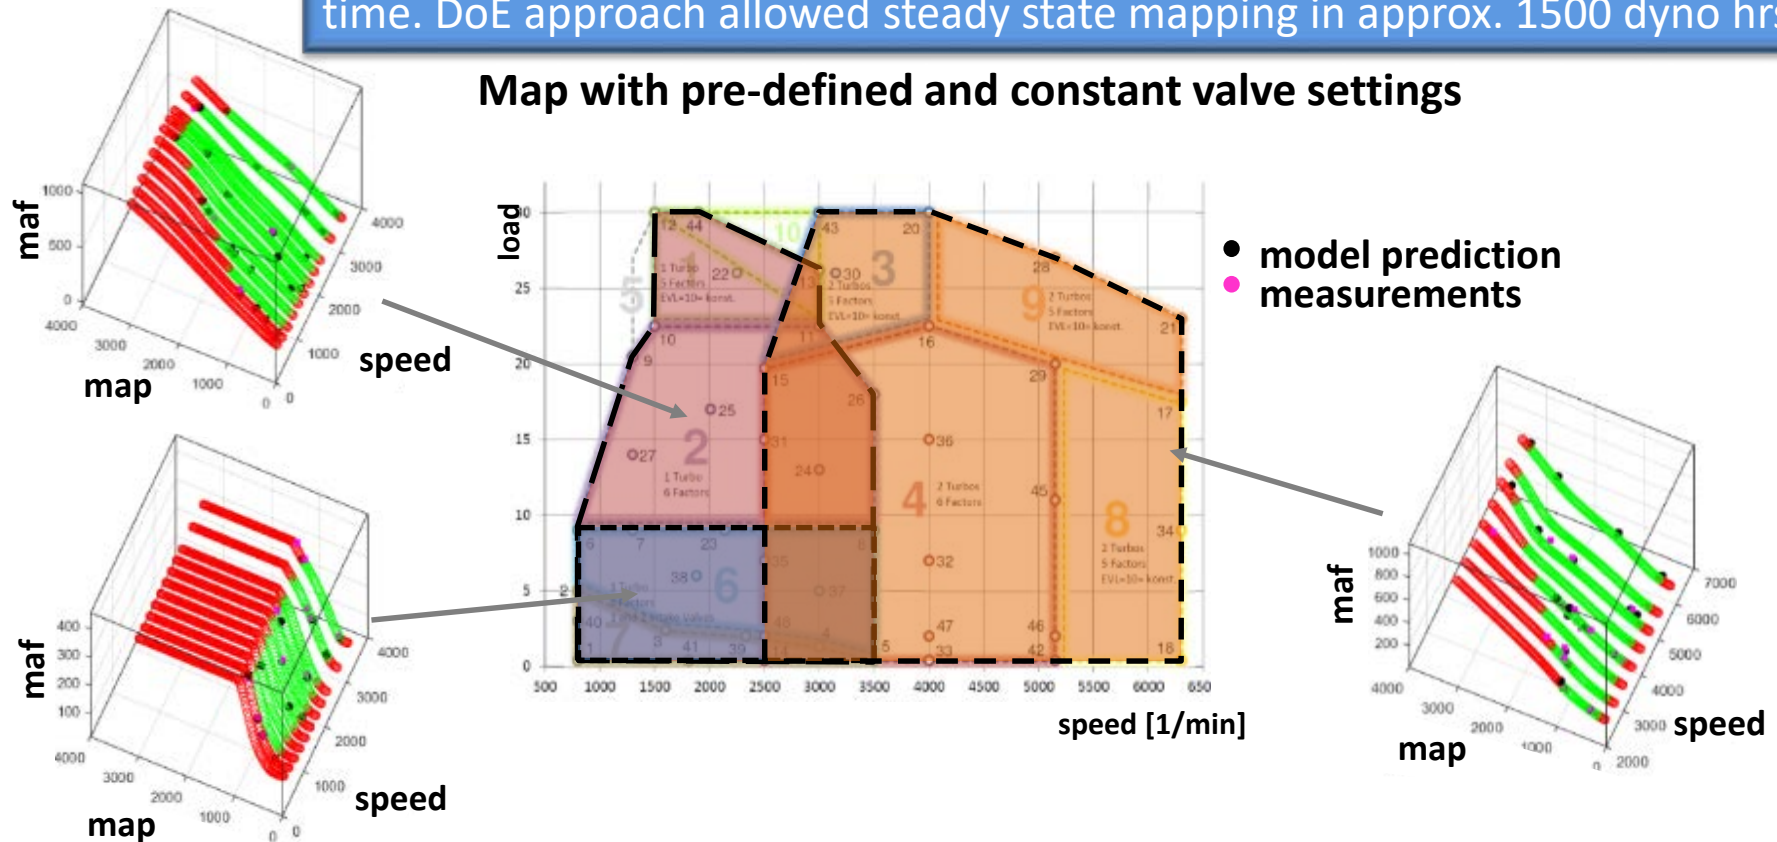

Steady State Calibration (Ford)

Large set of calibration parameters → DoE for steady state calibration → calibration time ↓.

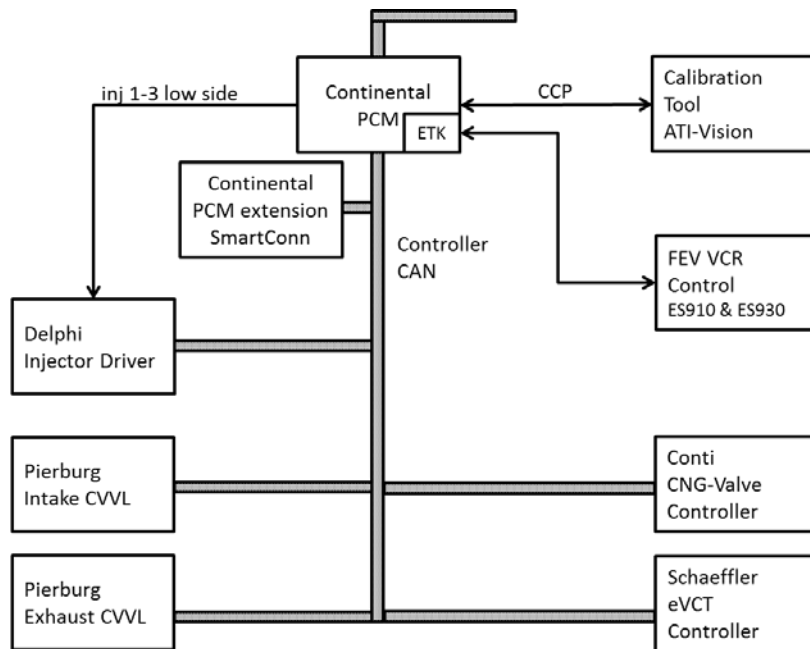

Full factorial data acquisition would have led to >1000 years of measurement time. DoE approach allowed steady state mapping in approx. 1500 dyno hrs.

Map with pre-defined and constant valve settings

ECU hardware, function and SW development (Continental)

Engine design with high degree of freedom in adjustable parameters, required complex interaction of 7 (8) control units and development of new software functionalities

Development of project specific functionality

- **Control of ECU subsystems**
 - Delphi (injectors), Schaeffler (e-VCT) and Pierburg (CVVA), Continental (gas system management)
- **Emission related functionality**
 - Catalyst warm up strategy by lambda split
 - Catalyst keep warm strategy using CVVA system
 - Spark retard and waste gate control at engine after start
- **Driveability and component protection related functionality**
 - Turbo charger over speed protection TC1 / TC2
 - Time to torque improvement strategy

Vehicle Calibration (Continental / Ford) – CNG DI Injection Timing

Delphi CNG DI technology offers improved time to torque capability by application of late SOI (Start of Injection)

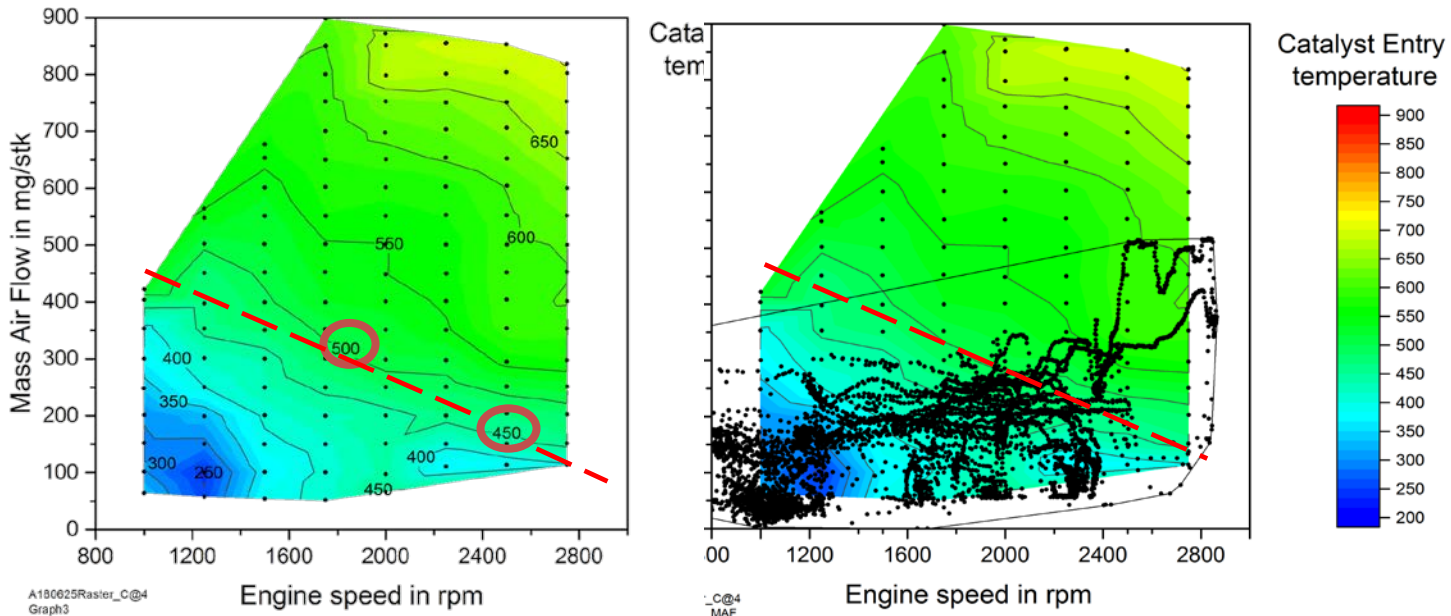

Late SOI increases air mass flow to cylinder

- increases low end engine torque
- generates additional heat for TC speed up
- improves downsizing capability

Vehicle Calibration – Emission Capability: Catalyst Heating Requirements

Efficiency optimized vehicle calibration leads to very low catalyst temperatures and thus conversion issues at low load → Countermeasure: Implementation of “Lambda Split”

- CH_4 conversion requires min. catalyst temperatures of 450 – 500°C
- Catalyst temperature not sufficient for CH_4 conversion in most parts of NEDC
- Countermeasure: Implementation of “Lambda Split Function” (2 cylinder rich and 1 cylinder lean) → de-balancing increases generation of CO
- CO oxidation in the catalyst generates additional heat directly in the catalyst (no heat losses).

Graph3

_C@4
_MAF

Vehicle Calibration (Continental) – Emission Calibration

Cylinder deactivation during fuel cut off introduced to reduce HC emissions.

- Pierburg CVVA system on intake side offers cylinder deactivation
- Cylinder deactivation used in order to prevent catalyst cooling at engine motoring and fuel cut off phases
- Reduction of HC peaks after fuel cut off phases due to higher catalyst temperature

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Demo Vehicle: Storage System Design & Installation (Ford)

6 tanks installed: range approx. 650 km, 600 km range target overachieved

- 4 bottles underbody replace the original gasoline tank
- 1 bottle below trunk (vehicle body modified, spare wheel well removed).
- 6th mounted in the trunk behind 3rd seat row.
- 7-seater capability maintained

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Demo Vehicle: Engine & Subsystems Installation (Ford)

Engine packaged in Ford C-MAX without any violation of design requirements (e.g. crash)

- GasOn engine installed in the CNG vehicle: new PCV system on top

- GasOn engine installed in the CNG vehicle: split compressor air routing

Demo Vehicle: Refinement & Full Assessment (Continental, Ford)

NEDC, WLTP and RDE Tests: HC, CO, NOx and PN below EU6 emission limits

Final emission results

- All NEDC, WLTP and RDE emissions - CO, NOx, PN, THC, NMHC below EU6 limits
- CO₂ target (> 20 % below BIC 2014 CNGV in NEDC) achieved

~1% CO₂ reduction for homologation fuel G20/G25, since tests were carried out with pump fuel (approx. 95 % CH₄ and 5% C₂H₆). Replacement of 7 ECUs by 1 integrated ECU would lead to additional 0.5 – 0.7 gCO₂/km reduction by reduction of electrical load

	Bag	HC [mg/km]	CO [mg/km]	CO ₂ [g/km]	Corrected CO ₂ [g/km]	NOx [mg/km]	NMHC [mg/km]	HC + NOx [mg/km]	Fuel econ. [m3/100km]	Particulate [mg/km]	PN [1/km]

Demo Vehicle: Refinement & Full Assessment (Continental, Ford)

NEDC, WLTP and RDE Tests: HC, CO, NOx and PN below EU6 emission limits

Final emission results

- All NEDC, WLTP and RDE emissions - CO, NOx, PN, THC, NMHC below EU6 limits
- CO₂ target (> 20 % below BIC 2014 CNGV in NEDC) achieved

For comparison:

Ford Grand C-MAX	WLTP CO ₂ / g/km
GasOn CNG 1.0 l (120 kW)	120 ... 126
Gasoline 1.5l Ecoboost (110 kW)	169 ... 172
Diesel 2.0l TDCi (110 kW)	146 ... 152

Gas-Only Internal Combustion Engines

Work Package 3: Advanced boosting and VCR for downsized CNG engines
Ford, Continental, Delphi, FEV, Schaeffler, Pierburg

Conclusion

Engine level: Dedicated CNG engine with CNG-DI, advanced twin parallel sequential boosting system, variable valve actuation, high compression ratio and high combustion pressure capable base engine architecture vs. VCR successfully tested with regard to efficiency and emission targets. Final vehicle installation of Non-VCR version.

CO2 reduction >20 % (NEDC) vs. best in class CNG vehicle 2014 achieved.

Upgraded CNG storage system ensures a full driving range of ~650 km while 7-seats are kept

EU6 emission limits met in NEDC, WLTP and RDE with a single 3-way-catalyst. PM and PN are extremely low without any filtration device.

Power target (110 KW) overachieved (120 KW) and BMEP target (30 bar) met.

Thanks for your attention
